Significant Capex Savings Identified on Brazil Phosphate Projects

Highlights

- **Significant capex savings identified through the use of pre-existing treatment plants located within an economic trucking distance of Aguia's phosphate orebodies.**
- **Negotiations for a lease or purchase agreement on an existing plant are at an advanced stage, anticipating finalising terms this month. Successful closure will negate the need for the development of processing operations at the Tres Estradas location.**
- **If a transaction can be concluded, Aguia estimates it can produce the same annual tonnage outlined in the original BFS for Tres Estradas for less than 25% of the original CAPEX. First production could occur by mid 2025.**
- **Negotiations underway with Brazilian Development Bank to renew \$4.48m loan to debt fund up to 70% of project development costs, thus minimising dilution for shareholders.**
- **Aguia is anticipating a very simple operation involving free digging, drying and physical reduction in size to a – 2mm saleable product without the need for chemicals.**
- **Drilling in progress to prove up a second large phosphate resource at Mato Grande project. First assay results are pending.**

Aguia's Executive Chairman, Warwick Grigor commented: *"Aguia's phosphate assets in Brazil offer the potential for a long-life operation, as already demonstrated by previously released BFS studies. The ability to minimise up front capital costs through the use of pre-existing treatment facilities could greatly improve the economics of the operation and enable a fast-tracking route to positive cashflow. We are well-advanced with our review of several plants and the assessment of the project economics, and we will look to finalise a transaction in the near term. Our objective is to commence production at our phosphate projects around mid 2025 and I look forward to updating shareholders on progress here."*

Sydney, Australia: Aguia Resources Limited (ASX: AGR) ('Aguia' or the 'Company') is pleased to provide shareholders with an update on the 100%-owned Tres Estradas Phosphate Project (Project) located near Lavras do Sul, Rio Grande do Sul, southern Brazil. The Project is based on the production of an organic phosphate fertiliser by the mining and processing of the saprolite ore. This soft, oxidised material is free-digging and is expected to enable the production of organic phosphate fertiliser with grades of 8-10% P₂O₅.

The earlier Bankable Feasibility Study ('BFS'), released to the ASX on 23 March 2023, disclosed impressive project economics based on the Tres Estradas deposit with highlights being:

Mineral Resource	5.338 Mt at 8.81% P ₂ O ₅ (Measured and Indicated)
Mineral Reserve	5.02 Mt at 8.8% P ₂ O ₅ (Proved and Probable)
Product Sold	4.768 Mt at 10.1% P ₂ O ₅
Waste:Ore	0.46:1.00 (average).
Production Rate	~300,000 tpa of saleable product
Life of Mine	18 years
Capital Expenditure	A\$26.2m
Operating Costs	A\$35.32 per tonne
EBITDA	A\$22m p.a.
IRR	54.7%

While these numbers suggest a good, long life profitable project, the Company has been assessing a number of alternative processing options that could significantly improve project economics. Specifically, the availability of pre-existing processing facilities could see production occur in mid CY2025, and result in a similar production rate for a capital expenditure reduction to less than 25% of the original BFS estimate for a new processing facility.

Process Route and Expected Costs

Agua has been negotiating a lease/purchase arrangement on an existing processing plant located within an economic trucking distance of the Tres Estradas deposit, that will involve minimal up-front payments, with subsequent leasing costs that will be financeable out of operating cash flow. It is expected that the arrangement will involve an option to purchase the facility at a subsequent point in time. The profitability of the projects should be confirmed by cash flows generated from operations before a final purchase would be made. The objective is to minimise financial risk for the benefit of shareholders.

The soft nature of the sapolite ore means that a crushing circuit will probably not be needed, however, the Company is assessing the introduction of a rotary kiln into the processing circuit to reduce the moisture content of the rock phosphate prior to producing a – 2mm product. A bagging facility will also be needed. The cost of the plant modifications is still being assessed, but the Company expects that they may cost in the order of A\$5m. This compares very favourably with the BFS estimate of \$26m for a new facility.

Addressable Market Within 300 km of the Mine

Currently, the Rio Grande do Sul market is 100% dependent on imported phosphate. The anticipated annual production of ~300,000 tonnes of organic phosphate fertiliser will equal approximately 15% of the existing demand for this nutrient in a 300 km radius of the mine site. The size of the local market is sufficiently large that expanded rates of production could be readily absorbed.

The product has been marketed under the name of *Pampafos* for the past three years. It has been well accepted within the local markets due to the outstanding results from agronomic testing. Importantly it has

been scientifically tested and shown to be soluble and therefore able to be absorbed by plant life. It has been tested on the five major global grain crops over four years and consistently found to be equivalent and in some cases better than the chemical equivalent. The product also contains a combination of unique macro and micronutrients which are and are considered to contribute to the success of *Pampafos* in the field.

Second Ore Source Being Drilled and Evaluated

Agua is also pleased to confirm that it has commenced drilling of a second 100%-owned phosphate project, Mato Grande, with the aim being to scale up its current resource base given the growing demand in the region. Earlier drilling has already defined the extent of the mineralisation. The current drill program is designed to allow the calculation of a JORC Mineral Resource Estimate and subsequent pit design. The addition of this material has the potential to extend the life of the operation beyond the initial 18 years, and/or the expansion of production capacity. There are an additional four carbonatites yet to be assessed by drilling, that may be additional ore sources.

Project Funding – Potential for Debt Finance

In June 2021, the Company advised that the local Development Bank, (Banco Regional de Desenvolvimento do Extremo Sul) (BRDE), had approved a loan facility of \$4.48m for the development of the Tres Estrades Project. As it happens, the Company did not draw on this facility at the time. Agua is currently in discussions with the bank to renew the loan facility for up to 70% debt funding, thereby alleviating the need for excessive dilution of shareholders in the funding of the proposed mine.

About Agua Resources Limited

Agua Resources is an ASX-listed multi-commodity company (AGR:ASX) with pre-production phosphate projects located in Rio Grande do Sul, the southernmost state of Brazil. Agua has an established and highly experienced in-country team based in Porto Alegre, the capital of Rio Grande do Sul. The acquisition of Andean Mining has added a portfolio of gold, silver and copper projects to its asset base.

JORC Code Competent Persons Statement

The information in this report that relates to Exploration Targets, Exploration Results, Mineral Resources or Ore Reserves is based on information compiled by Dr. Fernando Tallarico, who is a member of the Association of Professional Geoscientists of Ontario. Dr. Tallarico is a full-time employee of the company. Dr. Tallarico has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Dr. Tallarico consents to the inclusion in the report of the matters based on his information in the form and context in which it appears. Mr. Guilherme Gomides Ferreira, a Mining Engineer and employee of GE21, registered as a Competent Person in the AIG (Australian Institute of Geoscientists). Mr. Ferreira has sufficient relevant experience to the style of mineralization, mining methods and process to qualify as a Competent Person as defined in the JORC Code (2012). The report compilation was done by Mr. Bernardo H C Viana, a geologist and full-time director and owner of GE21 and is registered as Competent Person in the AIG (Australian Institute of Geoscientists). Mr. Viana has sufficient relevant experience to the style of mineralization to qualify as a Competent Person as defined in the JORC Code (2012). Mr. Viana also meets the requirements of a Competent Person under the AIM Note for Mining, Oil and Gas Companies. Mr. Porfirio Cabaleiro Rodriguez is a Mining Engineer and full-time director and owner of GE21 and is registered as Competent Person in the AIG (Australian Institute of Geoscientists), he has sufficient relevant experience to the style of mineralization to qualify as a Competent Person as defined in the JORC Code (2012). Mr. Viana, Mr. Ferreira and Mr. Rodriguez consent to the inclusion in this report of the matters based on the GE21 study in the form and context in which it appears.

Caution regarding forward-looking information:

This announcement is for information purposes only and does not constitute a prospectus or prospectus equivalent document. It is not intended to and does not constitute, or form part of, an offer, invitation or the solicitation of an offer to purchase or otherwise acquire, subscribe for, sell or otherwise dispose of any securities, or the solicitation of any vote or approval in any jurisdiction, nor shall there be any offer, sale, issuance or transfer of securities in any jurisdiction in contravention of any applicable law. This press release contains "forward looking information" within the meaning of applicable Australian securities legislation. Forward looking information includes, without limitation, statements regarding the next steps for the project, timetable for development, production forecast, mineral resource estimate, exploration program, permit approvals, timetable and budget, property prospectivity, and the future financial or operating performance of the Company. Generally, forward looking information can be identified by the use of forward-looking terminology such as "plans", "expects" or "does not expect", "is expected", "budget", "scheduled", "estimates", "forecasts", "intends", "anticipates" or "does not anticipate", or "believes", or variations of such words and phrases or state that certain actions, events or results "may", "could", "would", "might" or "will be taken", "occur" or "be achieved".

Forward-looking information is subject to known and unknown risks, uncertainties and other factors that may cause the actual results, level of activity, performance or achievements of the Company to be materially different from those expressed or implied by such forward-looking information, including, but not limited to: general business, economic, competitive, geopolitical and social uncertainties; the actual results of current exploration activities; other risks of the mining industry and the risks described in the Company's public disclosure. Although the Company has attempted to identify important factors that could cause actual results to differ materially from those contained in forward-looking information, there may be other factors that cause results not to be as anticipated, estimated or intended. There can be no assurance that such information will prove to be accurate, as actual results and future events could differ materially from those anticipated in such statements. Accordingly, readers should not place undue reliance on forward looking information. The Company does not undertake to update any forward-looking information, except in accordance with applicable securities law.

JORC Code, 2012 Edition – Table 1

Aguia Resources Limited (Aguia) in September 2020 contracted GE21 Consultoria Ltda (GE21) to prepare a Bankable Feasibility Study of Ore Reserves of the Três Estradas Phosphate Project (Três Estradas Project that in compliant with JORC Code (2012)

Mineral Resource classification of Três Estradas Project was performed by Millcreek Mining Group March 13, 2018, as verified by GE21 on NI43-101 Technical Report format named “Três Estradas Phosphate Project, Rio Grande do Sul, Brazil dated on April 4, 2018. GE21 received data related to the mineral resource certification and verified that there are no flaws in the mineral resources model. GE21 agrees with Mineral Resource classification from Millcreek.

The Company’s mineral property is considered to represent an Advanced Exploration Project which is inherently speculative in nature. The property is also considered to be sufficiently prospective in general, subject to varying exploration risk degrees.

Section 1 Sampling techniques and data
(Criteria in this group apply to all succeeding groups)

Criteria	JORC Code Explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. 	<ul style="list-style-type: none"> In the Três Estradas Project area procedures for soil sampling, rock chip samples and drilling samples (auger drilling, reverse circulation and diamond drilling) were compliant with mineral industry standards. Samples were sent to laboratories that are commercial fee-for-service testing facilities and are independent of Aguia
	<ul style="list-style-type: none"> Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information. 	<ul style="list-style-type: none"> Aguia has followed standard practices in their geochemical surveys, core, RC and auger drilling programs. They have followed a set of standard procedures in collecting cuttings and core samples, logging and data acquisition for the project. Their procedures are well documented and meet generally recognized industry standards and practices. All core logging is completed by Aguia geologists and directly entered into a comprehensive database program. Aguia's geologists are responsible for identifying and marking core intervals for sampling. Sample intervals range in length from 0.15m to 6.20m with 90% of all core samples falling within the range of 0.8m to 1.2m. Digital and hard copies of all sampling and shipment documentation are stored in the project office at Lavras do Sul. Documentation includes geological logs, core photographs, core recovery records, portable XRF readings and down-hole surveys.
Drilling techniques	<ul style="list-style-type: none"> Drill type (eg. core, reverse circulation, open-hole hammer, 	<ul style="list-style-type: none"> Aguia has completed five drilling campaigns on the Tres Estradas area between 2011 and 2017. Drilling has included 139 core holes (20,509.5m), 244 reverse circulation (RC) holes

Criteria	JORC Code Explanation	Commentary
	rotary air blast, auger, Bangka etc.) and details (eg. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).	(7,800.0m) and 487 auger holes (2,481.65m). <ul style="list-style-type: none"> All core holes were drilled using wireline coring methods. HQ size (63.5mm diameter core) core tools were used for drilling through weathered material and NQ size (47.6mm diameter core) tools were used for drilling through fresh rock. Core recovery has exceeded 90% in 97% of all core holes. RC drilling was used to complete 244 holes with a cumulative length of 7,800.0m. All RC holes were drilled vertically (-90°) using 140mm button hammer bit. Holes were primarily drilled dry.
Drill sample recovery	<ul style="list-style-type: none"> Whether core and chip sample recoveries have been properly recorded and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	<ul style="list-style-type: none"> Digital and hard copies of all sampling and shipment documentation are stored in the project office at Lavras do Sul. Documentation includes geological logs, core photographs and core recovery records. Aguia has followed standard practices in their core, RC, and auger drilling programs. They have followed a set of standard procedures in collecting cuttings and core samples, logging, and data acquisition for the project. Their procedures are well documented and meet generally recognized industry standards and practices. Millcreek considers the exploration data collected by Aguia to be of sufficient quality to support mineral resource evaluation. There was no investigation about relationship between sample recovery and grade.
Logging	<ul style="list-style-type: none"> Whether core and chip samples have been logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core (or costean, channel etc.) photography. The total length and percentage of the relevant intersections logged. 	<ul style="list-style-type: none"> Digital and hard copies of all sampling and shipment documentation are stored in the project office at Lavras do Sul. Documentation includes geological logs, core photographs, core recovery records, portable XRF readings and down-hole surveys. Detailed geological logs are completed for every core hole using an appropriate logging form. Sampling intervals in the amphibolite and the carbonatite are typically targeted for a 1.0m length but may fall within a range of 0.50m to 1.50m. Samples in the unmineralized gneiss host rock may have considerably longer lengths of up to 6.2m. The logging is qualitative in nature. A photographic record is maintained for all core boxes with each photograph recording three boxes: 100% diamond drillholes was logged. The portable XRF is used for RC Drilling samples to screen samples for further testing at the analytical laboratory.
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> If core, whether cut or sawn and whether quarter, half or all core taken. 	<ul style="list-style-type: none"> Fresh core is split lengthwise using a core saw. Samples are systematically taken using the right half of the core, returning the left half of the core to the core box for archival storage.

		 <ul style="list-style-type: none"> • The permits #810.090/1991 and #810.325/2012 had the Final Exploration Report approved by ANM on August 17th, 2020. Agüia filed the Economic Assessment Plan (PAE) on October 26th, 2020, which is currently under ANM's review. • Falcon has requested for an extension of the permit 810.988/2011 which is currently under ANM's review. The transfer request of the mineral rights, from Falcon to Agüia, regarding the permit #810.988/2011 is under ANM's review.

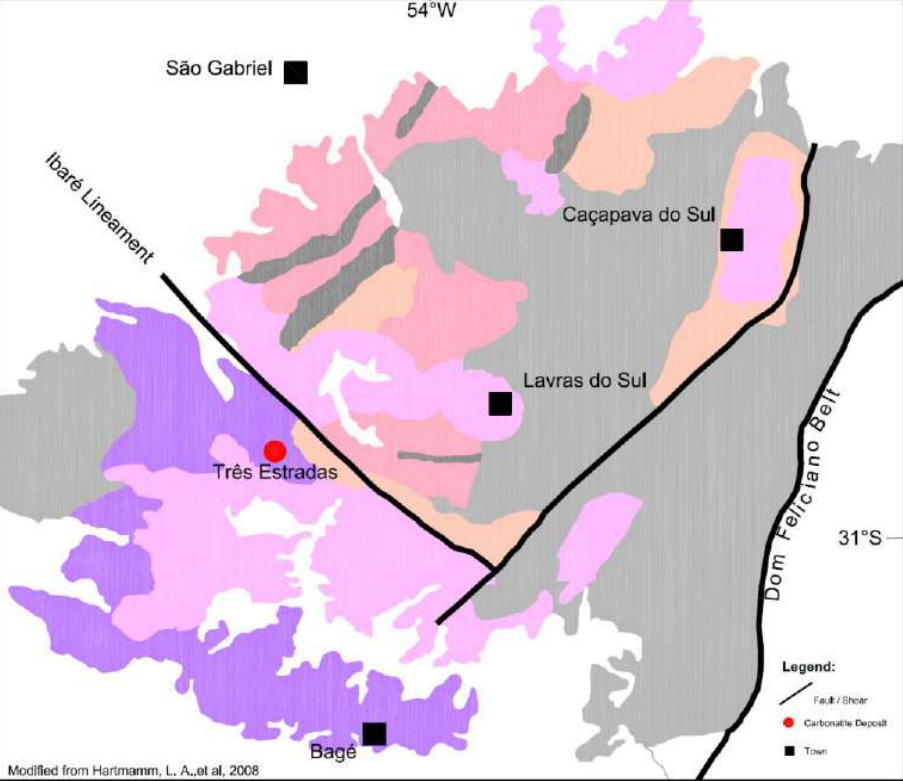

INDEPENDENT TECHNICAL REPORT ON EXPLORATION AND MINERAL RESOURCE ESTIMATE
TRES ESTRADAS PHOSPHATE PROJECT | AGUIA RESOURCES LIMITED

Criteria	JORC Code Explanation	Commentary
Exploration done by other parties	<ul style="list-style-type: none"> Acknowledgment and appraisal of exploration by other parties. 	<ul style="list-style-type: none"> Lavras do Sul was originally developed in the 1880's as a gold mining camp on the Camaquã of Lavras River. In 1959, more detailed studies were organized by the ANM, which were followed in the 1970s by major survey and sampling programs of all mineral occurrences by the Companhia de Pesquisa e Recursos Minerais (CPRM – The Geological Survey of Brazil). In recent years there have been renewed exploration activities for gold and base metals in the region by Companhia Brasileira do Cobre (CBC), Amarillo Mining, Companhia Riograndense de Mineração (CRM) and Votorantim Metais Zinco SA. Phosphate mineralization was first observed at Três Estradas in a gold exploration program being conducted jointly by Santa Elina and CBC. Santa Elina was prospecting for gold in ANM #810.090/1991, conducting soil, stream sediment and rock geochemistry, ground geophysical surveys (magnetrometry and induced polarization) and a limited drilling program. Exploration results for gold were not encouraging and Santa Elina pulled out of the joint venture with CBC. However, the phosphate chemical analysis from two core boreholes in the ANM #810.090/1991 area yielded results of 6.41% P₂O₅ from soil and 6.64% P₂O₅ from core. This information was communicated to CPRM. Following petrographic studies, apatite mineralization occurring in carbonatite was confirmed. In July 2011, CBC entered into a partnership with Aguia Metais Ltda, a subsidiary of Aguia Resources Ltd., to explore and develop phosphate deposits in Rio Grande do Sul State.

<p>Geology</p>	<ul style="list-style-type: none"> • Deposit type, geological setting and style of mineralisation. 	<ul style="list-style-type: none"> • The Três Estradas Phosphate Project is situated in the Santa Maria Chico Granulitic Complex (SMCGC), part of the Taquarembó domain (Figure below). The SMCGC exposes the deepest structural levels within Brazil and may represent the western edge of the Precambrian Rio de la Plata Craton. The Três Estradas deposit consists of an elongated carbonatite intrusion (meta-carbonatite and amphibolite) with a strike of 50° to 60°. The meta-carbonatite and amphibolite form a tightly folded sequence with limbs dipping steeply from 70° to vertical (90°). The surface expression of the intrusion is approximately 2.5 km along strike with a width of approximately 300m. The Late Archean to Early Proterozoic intrusion is intensely recrystallized and metamorphosed to amphibolite assemblages. The carbonatite intrusion is bound mostly by biotite gneiss along with meta-syenite along its northeast and southeast boundaries. • Phosphate mineralization, occurring as the mineral apatite ($\text{Ca}_5(\text{PO}_4)_3(\text{F}, \text{Cl}, \text{OH})$), is the primary mineralization of economic interest at Três Estradas. Apatite is the only phosphate-bearing mineral occurring in the carbonatites. At Três Estradas phosphate mineralization occurs in both fresh and weathered meta-carbonatite and amphibolite. Phosphate also becomes highly enriched as secondary mineralization in the overlying saprolite.

<p>Other substantive exploration data</p>	<ul style="list-style-type: none"> • Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples - size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. 	<ul style="list-style-type: none"> • One historical trench exists on the tenement, cut perpendicular to the meta-carbonatite. According to Aguia, this trench was dug over 10 years ago by Santa Elina while prospecting for gold in the area. Within the trench Aguia sampled three vertical channels. Within each channel, two samples were collected from bottom to top. The P₂O₅ results from these samples vary from 24.10% to 28.80%. • Aguia made use of data from an airborne geophysical survey completed by CPRM, using rectified imagery for Total Magnetic Field (TMF), signal amplitude of TMF, First Derivative of the TMF, Uranium Concentration and Total Count of Gamma spectrometry. The magnetic anomalies identified in the airborne survey assisted in delineating areas of interest and led to Aguia completing a ground-based magnetic survey over the entire northern tenement area in March 2012. The survey was carried out by AFC Geofisica, Ltda. from Porto Alegre, Brazil. The survey comprised 104 line kilometers oriented northsouth. Survey lines and control lines were spaced at 25m and 100m apart respectively.

INDEPENDENT TECHNICAL REPORT ON EXPLORATION AND MINERAL RESOURCE ESTIMATE
TRES ESTRADAS PHOSPHATE PROJECT | AGUIA RESOURCES LIMITED

Criteria	JORC Code Explanation	Commentary
Estimation and modelling techniques	<ul style="list-style-type: none"> • The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters, maximum distance of extrapolation from data points. • The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data. • The assumptions made regarding recovery of by-products. • Estimation of deleterious elements or other non-grade variables of economic significance (e.g. sulphur for acid mine drainage characterisation). • In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed. • Any assumptions behind modelling of selective mining units. • Any assumptions about correlation between variables. 	<ul style="list-style-type: none"> • All assays were composited to 1.0m lengths. A high-grade limit was identified for each mineral domain and shows 9% P₂O₅ was selected as the high-grade limit. Therefore, in the grade estimation process of P₂O₅, when the composite grade reaches 9% or more the size of search ellipsoids reduces to half of its original size. • Three estimation passes were used with progressively relaxed search ellipsoids and data requirements based on the Variography: <ul style="list-style-type: none"> • Pass 1: Blocks estimated in the first pass using half the distance of variogram range and based on composites from a minimum of three boreholes. • Pass 2: Blocks estimated in the first two passes within the full range of the variogram and based on composites from a minimum of two boreholes; and • Pass 3: All remaining blocks within the wireframe limits in an unconfined search not classified in the first two estimation passes. • No checks with previous estimates or mine production records have been made. • No estimation of recovery factors has been made. • The estimation for the six oxide variables (P₂O₅, CaO, Al₂O₃, Fe₂O₃, MgO, and SiO₂) and specific gravity were done using ordinary kriging interpolation for all the domains: MCBT, WMCBT, MAMP, CBTSAP and AMPSAP. • The block dimensions were defined as 12m x 6m x 10m, and drilling grid dimensions can be considered as 25m x 50m x 1m. Millcreek considers block sizes appropriate for mineral resource estimates. • None made. • No assumptions were made by Millcreek regarding the correlation between variables

INDEPENDENT TECHNICAL REPORT ON EXPLORATION AND MINERAL RESOURCE ESTIMATE
TRES ESTRADAS PHOSPHATE PROJECT | AGUIA RESOURCES LIMITED

Criteria	JORC Code Explanation	Commentary
	<ul style="list-style-type: none"> Description of how the geological interpretation was used to control the resource estimates. 	<ul style="list-style-type: none"> Aguia performed a series of variograms and variogram maps in GEMS mining software to model the spatial continuity of the six oxides (P₂O₅, CaO, Al₂O₃, Fe₂O₃, MgO, and SiO₂) and for specific gravity of MCBT and MAMP. Grade estimations were made using ordinary kriging interpolation for all of the mineralized domains
Estimation and modelling techniques (cont.)	<ul style="list-style-type: none"> Discussion of basis for using or not using grade cutting or capping. The process of validation, the checking process used, the comparison of model data to drillhole data, and use of reconciliation data if available. 	<ul style="list-style-type: none"> Under supervision of Millcreek, Aguia conducted a top-cut analysis. Through visual inspection of the gradual changes of the mean values, a high-grade limit was identified for each mineral domain. 9% P₂O₅ was selected as the high-grade limit. Therefore, in the grade estimation process of P₂O₅, when the composite grade reaches 9% or more the size of search ellipsoids reduces to half of its original size. Millcreek has conducted an audit of the block model prepared by Aguia and of the resources estimated from the model. Millcreek loaded the Tres Estradas block model into the Maptek Vulcan software system, a geology and mine planning software that competes directly with GEMS. The Millcreek audit and validation of the Tres Estradas block model consisted of the following steps: <ol style="list-style-type: none"> 1. Visual Validation: The drill hole composited drilling data was loaded into Vulcan software to compare the grade estimation block/drill hole grade relationships in cross section view. A visual inspection of vertical cross sections spaced at 50m spacing along the strike of the mineralization showed strong correlation between drill hole assays and composited values in the model. 2. Statistical Validation: Two types of statistical validations were carried out: general statistical comparisons and statistical structures: General statistics and comparison of histograms 3. Spatial Validation (Swath plots): The block model was evaluated using a series of swath plots. A swath plot is a graphical display of the grade distribution derived from a series of bands, or swaths, generated as sections through the deposit. 4. Specific Gravity (SG) Model Validation: The SG composited data was used to create a kriged model that represents the variability of SG in the deposit.
Moisture	<ul style="list-style-type: none"> Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content. 	<ul style="list-style-type: none"> Sample weighting and assay analysis were performed on dry basis.
Cut-off parameters	<ul style="list-style-type: none"> The basis of the adopted cut-off grade(s) or quality parameters applied. 	<ul style="list-style-type: none"> Mineral resources are reported within a conceptual pit shell at a cutoff grade of 3% P₂O₅.

Criteria	JORC Code Explanation	Commentary
Mining factors or assumptions.	<ul style="list-style-type: none"> Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It may not always be possible to make assumptions regarding mining methods and parameters when estimating Mineral Resources. may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made. 	<ul style="list-style-type: none"> Using the Lerchs-Grossman algorithm, Millcreek has developed a mineable pit shell using the above parameters. The pit shell captures the resources estimated in the block model that have reasonable prospects for economic extraction. The pit optimization results are used solely for the purpose of testing the “reasonable prospects for economic extraction” and do not represent an attempt to estimate mineral reserves, simply what portion of the resource is considered ‘mineable’. Further work has been performed to propose the portion of the ‘mineable’ resource that is economically optimized.
Metallurgical factors or assumptions.	<ul style="list-style-type: none"> The basis for assumptions or predictions regarding metallurgical amenability. It may not always be possible to make assumptions regarding metallurgical treatment processes and parameters when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made. 	<ul style="list-style-type: none"> The pit optimization also considers the recovery of calcite as a by-product to mining and processing of the meta-carbonatite. Calcite recovery through column flotation is further addressed in subsequent sections of the report.

Criteria	JORC Code Explanation	Commentary
Bulk density	<ul style="list-style-type: none"> • Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples. • The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit. • Discuss assumptions for bulk density estimates used in the evaluation process of the different materials. 	<ul style="list-style-type: none"> • During the first drilling campaign in 2011, the specific gravity of 48 core samples were measured by SGS Geosol using a standard weight in water and weight in air methodology. • Uncut core segments of approximately 15 to 20 centimeter lengths were wrapped in PVC film and submerged in water. Aguia took over this testing with all subsequent drilling following the same procedures used by SGS Geosol. To date, 4,216 specific gravity measurements have been determined for Três Estradas. • Density values were estimated on block model by ordinary kriging interpolation for each mineralization domain separately.

Criteria	JORC Code Explanation	Commentary
Classification	<ul style="list-style-type: none"> The basis for the classification of the Mineral Resources into varying confidence categories. Whether appropriate account has been taken of all relevant factors. i.e. relative confidence in tonnage/grade computations, confidence in continuity of geology and metal values, quality, quantity and distribution of the data. Whether the result appropriately reflects the Competent Person(s)' view of the deposit. 	<ul style="list-style-type: none"> The resource classification involved a two-stage process. Stage 1: Relevant mathematical parameters were saved in the block model and the blocks. These variables are Interpolation pass; Distance of the closest sample from the block; Average distance of samples used in estimating any; Number of drill holes used for estimating any; The kriging variance of grade estimation. Stage 2: The above variables were used as supporting mathematical variables for finalization of the resource classification process. At this stage, the resource blocks were coded manually. The two-stage process of classifying resources follows a 'best practices' approach allowing the QP to ensure that unreasonable conditions of: 1) measured blocks and inferred category blocks occurring side-by-side and 2) the measured and indicated blocks are not dominated by blocks with low sample support.

<ul style="list-style-type: none"> • Mine equipment will be provided by a contractor for the first 3 years and from year 4 onwards, all mine equipment will be bought. The mining equipment is based on a small-scale mining projection to meet the selectivity requirements of the proposed mining. A JCB JS220LC hydraulic excavator, or similar, equipped with a 2.0m³ bucket, as well as Scania trucks, or similar, with 10m³ (36t) capacity was selected. • The final pit design is presented below. 																																																																																			

INDEPENDENT TECHNICAL REPORT ON EXPLORATION AND MINERAL RESOURCE ESTIMATE
 TRES ESTRADAS PHOSPHATE PROJECT | AGUIA RESOURCES LIMITED

- The mining dilution factors used.
- The mining recovery factors used.
- Any minimum mining widths used.
- The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.
- The infrastructure requirements of the selected mining methods.

Metallurgical factors or assumptions

- The metallurgical process proposed and the

ROM will be transported by 36t trucks from the mine to the stockpile area to natural drying process. After the natural drying process, the ROM will be reclaimed from the stockpile with a front-end loader and a truck to feed the processing plant.

INDEPENDENT TECHNICAL REPORT ON EXPLORATION AND MINERAL RESOURCE ESTIMATE
TRES ESTRADAS PHOSPHATE PROJECT | AGUIA RESOURCES LIMITED

	<p>appropriateness of that process to the style of mineralisation.</p> <ul style="list-style-type: none"> • Whether the metallurgical process is well-tested technology or novel in nature. • The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied. • Any assumptions or allowances made for deleterious elements. • The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the orebody as a whole. 	<p>Considering the production of a DANF product during the Project Phase 1 the facility will consist of simple processing plant with the following flow:</p> <ul style="list-style-type: none"> • The transported material is dumped into a vibrating feeder with capacity of 120 tph. • Closed Milling Circuit – Consisting of a hammer mill system and conveyance to the High-Frequency Sieve system with conveyance of coarse fraction back to the mills and fine fraction conveyance to the storage silo. • Bagging and bulk Circuit – Consisting of a bagging system and a bulk system working in parallel, bag filter and conveyance to the product warehouse.

INDEPENDENT TECHNICAL REPORT ON EXPLORATION AND MINERAL RESOURCE ESTIMATE
 TRÊS ESTRADAS PHOSPHATE PROJECT | AGUIA RESOURCES LIMITED

	<ul style="list-style-type: none"> For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications? 	
<p><i>Environmental</i></p>	<ul style="list-style-type: none"> <i>The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.</i> 	<p>A comprehensive Environmental and Social Impact Assessment (EIA/RIMA), that meets national and international standards, was undertaken in 2015 and 2016 by Golder Associates based on over 14 months of field data collection and subsequent interpretation. The EIA/RIMA was submitted to State Government Agency (FEPAM) in October/2016. Aguia produced an updated version of the EIA / RIMA in September/2017. FEPAM requested additional information regarding the EIA/RIMA in October/2018, Abril/2019 and July/2019, which were respectively answered by Aguia in December/2018, May/2019 and August/2019. The Public consultation for the Três Estradas Phosphate Project held in Lavras do Sul in March 20th ,2019. The EIA/RIMA was approved with the Preliminary License (LP) grating by FEPAM on October 15th, 2019.</p> <p>FEPAM granted the Installation License (LI) No. 00243/2022 for the so-called Phase 1 on November 31st, 2023. Nevertheless, the FEPAM subdivided the installation stage in Installation Step 1 and Installation Step 2. According to Technical Report DECONT nº 62/2022, the so-called Phase 1 – Step 1 excludes one of the properties (property 8), due to the lack of effective conclusion in the land acquisition negotiations with the landowner. However, once Aguia presents to FEPAM a proof of ownership or possession of the land property 8, based on an acquisition or leasing agreements, there are no impediments to the future reinclusion of the property currently excluded from Phase 1 – Installation Step 1.</p> <p>Based on the analysed documents, considering the characteristics of the Três Estradas Phosphate Project and the applicable legal regulations, the environmental viability of the intended mining activity has been proven, attested by the issuance of the Preliminary License and Installation License issued by FEPAM.</p>

<p><i>Infrastructure</i></p>	<ul style="list-style-type: none"> <i>The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.</i> 	<ul style="list-style-type: none"> The project site has good road access to within 9 km, and municipal road access to the site. It is nearby (27km) to Lavras do Sul city which will provide as well as house employees and provide basic services. The region has several other mines, and a well-established local coal industry, so equipment vendors and contractors are available to support the operations, as needed. Water will be impounded from a river at the property, and line power is available from transmission line 9 km away. A system of well-maintained roads links the mine to Porto Alegre (the capital city of the state) as well as to the markets in the north, east and west of the Rio Grande do Sul (RS) state. The terrain at the project site is reasonably level and has been shown by geotechnical analysis to provide competent foundations for the process plant, mine infrastructure, waste dumps, tailings storage, dykes, etc.

	<ul style="list-style-type: none"> • <i>The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products.</i> 	
<p><i>Market assessment</i></p>	<ul style="list-style-type: none"> • <i>The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future.</i> • <i>A customer and competitor analysis along with the identification of likely market windows for the product.</i> • <i>Price and volume forecasts and the basis for these forecasts.</i> • <i>For industrial minerals the customer specification, testing and acceptance requirements prior</i> 	<ul style="list-style-type: none"> • Phosphate is the primary nutrient for agriculture and a fundamental ingredient in many fertilizer products. Brazil has evolved into one of the world’s major exporters of food, and that position looks to strengthen given the projected increases in world population, in meat consumption by the growing middle-class, and in the use of biofuels. There is no local phosphate producer in the RS state which is currently 100% reliant on phosphate imports. • Aguia intends to use its logistical competitive position to capture a market share in the RS state by supplying initially 50 ktpy and reaching a production rate of approximately 300 ktpy of DANF product from year 4 to year 18 of the Três Estradas Phosphate Project – Phase I. • Lab results confirm that the DANF product it’s suitability to meet customer’s product specifications. Currently specific agronomic trials are in course to define the agronomic efficiency regarding distinct crops and types of soil. • For this work, GE21 considered the price of the DANF from year 1 to 15 at A\$ 120.00/t and A\$ 72.00/t in the years 16 to 18 due to the available ore grade.

INDEPENDENT TECHNICAL REPORT ON EXPLORATION AND MINERAL RESOURCE ESTIMATE
TRES ESTRADAS PHOSPHATE PROJECT | AGUIA RESOURCES LIMITED

- The below summarizes the taxes that are taken into account in this project economic evaluation.
- Taxes

Tax Rates	
Item	%
IRPJ (15% until R\$240.000,00 of Net profit before taxes)	15
IRPJ (10% over R\$240.000,00 of Net profit before taxes)	10
CSLL (9% of Net profit before taxes)	9
CFEM (2% of gross revenue)	2
Royalties - Free Cash Flow after payback	2

- The Project estimates a Net Present Value of AUD\$ 110.800million, at a Discount Rate of 10% per year post tax, as presented in below.

Economic

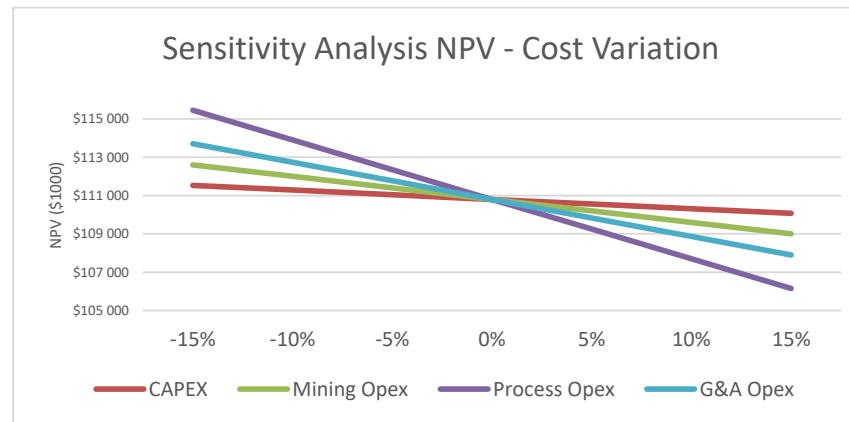

- The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic inputs including estimated inflation, discount rate, etc.
- NPV ranges and sensitivity to variations in the significant assumptions and inputs.

A sensitivity analysis was undertaken to evaluate the impact of the resulting economic indicators for the following attributes, within the cash flow:

- WACC
- Sell price.
- Mine OPEX

- Plant OPEX
- Exchange rate

The WACC, OPEX, NPV, was evaluated by varying its value from -15% to +15%. Figure below shows the sensitivity analysis developed by GE21.

	<p><i>the estimation and classification of the Ore Reserves:</i></p> <ul style="list-style-type: none"> • <i>Any identified material naturally occurring risks.</i> • <i>The status of material legal agreements and marketing arrangements.</i> • <i>The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent</i> 	<ul style="list-style-type: none"> • Aguia holds 100% interest in the three mineral rights permits covering the Tres Estradas Phosphate Project. • Aguia has started the process of land acquisition. • Aguia is currently in the phase of requirement for Installation Permit (LI). According to Brazilian law the LI is granted under the fulfillment of the LP conditions, approval of the mine development plan (PAE) by the National Mining Agency and it demonstrates economic feasibility and approval of an environmental control plan called the Basic Environmental Plan (PBA). • The Três Estradas Phosphate Project is located in a rural, low population density area comprising a large number of farms in which beef cattle and soybean crops are the main activities. The implementation of the Project structures will cause direct interference in rural properties, some of which will be acquired in the whole, while others will be purchased partially. The Project interfere on 11 properties totalling 449 hectares, Aguia plan is to acquire 345 hectares. The Company has successfully completed the acquisition of 10 properties covering 312.6 hectares (90.6%). Those cover most of the mine and entirely the plant site. At 23FY Half Year Report freehold land had a balance of AUD 1.8M relating to the fully paid properties for the implantation of the Project. Aguia intends to advance the negotiations to the landowner of the last property and expects to invest AUD 196,000 in that. The non-immediately acquisition does not prevent Aguia from building the plant, neither mining in the already acquired properties. This cost isn't included in the financial analysis as it is a deferred cost.
